

## Knowledge Representation and Reasoning

Several of the lectures in the first section of this course are based on the following book:

Ronald Brachman & Hector Levesque

Knowledge Representation and Reasoning

Morgan Kaufmann, 2004.

ISBN: ISBN: 978-1-55860-932-7.

These slides will be clearly identified.

Up-to-date slides for this book are available from:

<http://www.cs.toronto.edu/~hector/PublicKRslides.pdf>

Introduction

<https://powcoder.com>

What is knowledge?  
Add WeChat powcoder

Easier question: how do we talk about it?

We say “John knows that ...” and fill the blank with a proposition

- can be true / false, right / wrong

Contrast: “John fears that ...”

- same content, different attitude

Other forms of knowledge:

- know how, who, what, when, ...
- sensorimotor: typing, riding a bike
- affective: deep understanding

Belief: similar, but not necessarily true and/or held for appropriate reasons

- and weaker yet: “John suspects that ...”

Here: no distinction

The main idea:

taking the world to be one way and not another

## What is representation?

Symbols standing for things in the world

first aid

women

restaurant

"John"

John

"John loves Mary"

the proposition that  
John loves Mary

Knowledge representation:

symbolic encoding of propositions believed (by some agent)

Assignment Project Exam Help

Add WeChat powcoder

## What is reasoning?

Manipulation of symbols encoding propositions  
to produce representations of new propositions

Analogy: arithmetic

"1011" + "10" → "1101"

↓ ↓ ↓

eleven two thirteen

"John is Mary's  
father"

"John is an adult  
male"

## Why knowledge?

For sufficiently complex systems, it is sometimes useful to describe systems in terms of beliefs, goals, fears, intentions

e.g. a game-playing program

"because it believed its queen was in danger, but wanted to still control the center of the board."

more useful than description about actual techniques used for deciding how to move

"because evaluation procedure P using minimax returned a value of +7 for this position"

= taking an intentional stance (Daniel Dennett)

**But...**

Is KR just a convenient way of describing complex systems?

- sometimes anthropomorphizing is inappropriate  
e.g. thermostats
- can also be very misleading!  
fooling users into thinking a system knows more than it does

Add WeChat powcoder

## Why representation?

Note: intentional stance says nothing about what is / is not represented symbolically

e.g. in game playing

perhaps the board position is represented, but the goal of getting a knight out early is not

KR Hypothesis: (Brian Smith)

"Any mechanically embodied intelligent process will be comprised of structural ingredients that a) we as external observers naturally take to represent a propositional account of the knowledge that the overall process exhibits, and b) independent of such external semantic attribution, play a formal but causal and essential role in engendering the behaviour that manifests that knowledge."

- Two issues: existence of structures that
  - we can interpret propositionally
  - determine how the system behaves

Knowledge-based system:

one designed in this way!

## Two Examples

### Example 1

```
printColour(snow) :- !, write("It's white.").
printColour(grass) :- !, write("It's green.").
printColour(sky) :- !, write("It's yellow.").
printColour(X) :- write("Beats me.).
```

### Example 2

```
printColour(X) :- colour(X,Y), !,
    write("It's "), write(Y), write(".").
printColour(X) :- write("Beats me.).
```

```
colour(snow,white).
colour(sky,yellow).
colour(X,Y) :- madeof(X,Z), colour(Z,Y).
madeof(grass,vegetation).
colour(vegetation,green).
```

Both systems can be described intentionally

Only the 2nd has a separate collection of  
symbolic structures à la KR Hypothesis

its knowledge base (or KB)

is a small knowledge-based system

KB & AI  
Add WeChat powcoder

Much of AI involves building systems that are  
knowledge-based

ability derives in part from reasoning over explicitly  
represented knowledge

- language understanding,
- planning,
- diagnosis,
- "expert systems",
- ...

Some, to a certain extent

- game-playing,
- vision,
- ...

Some, to a much lesser extent

- speech,
- motor control,
- ...

Current research question:

how much of intelligent behaviour is knowledge-based?

Challenges: connectionism, others

## Why bother?

Why not “compile out” knowledge into specialized procedures?

- distribute KB to procedures that need it  
(as in Example 1)
- almost always achieves better performance

No need to think. *Just do it!*

- riding a bike
- driving a car
- playing chess?
- doing math?
- staying alive??

Skills (Hubert Dreyfus)

novices think; experts react

compare to current “expert systems”:

knowledge-based!

## Add WeChat Advantage powcoder

Knowledge-based system most suitable for *open-ended* tasks

can structurally isolate *reasons* for particular behaviour

Good for

- explanation and justification
  - “Because grass is a form of vegetation.”
- informability: debugging the KB
  - “No the sky is not yellow. It's blue.”
- extensibility: new relations
  - “Canaries are yellow.”
- new applications
  - returning a list of all the white things
  - painting pictures

Hallmark of KB'ed system:

the ability to be told facts about the world and adjust behaviour correspondingly

“Cognitive penetrability” (Zenon Pylyshyn)

actions that are conditioned by what is currently believed

e.g. do not leave the room on hearing a fire alarm if we believe that the alarm is being tested

so this action is cognitively penetrable

## Why reasoning?

Want knowledge to affect action

- not do action  $A$  if sentence  $P$  is in KB
- but do action  $A$  if world believed in satisfies  $P$

Difference:

- $P$  may not be explicitly represented
- Need to apply what is known to particulars of given situation

Example:

- "Patient  $x$  is allergic to medication  $m$ ."
- "Anybody allergic to medication  $m$  is also allergic to  $m'$ ."
- Is it OK to prescribe  $m'$  for  $x$ ?

Usually need more than just DE-style retrieval of facts in the KB

## Entailment

Sentences  $P_1, P_2, \dots, P_n$  entail sentence  $P$  iff the truth of  $P$  is implicit in the truth of  $P_1, P_2, \dots, P_n$ .

If the world is such that it satisfies the  $P_i$  then it must also satisfy  $P$ .

- Applies to a variety of languages
  - languages with truth theories

Inference: the process of calculating entailments

- sound: get only entailments
- complete: get all entailments

Sometimes want unsound / incomplete reasoning

- to be discussed later

Logic: study of entailment relations

- languages
- truth conditions
- rules of inference

## Using logic

### No universal language / semantics

Why not English?  
Different tasks / worlds  
Different ways to carve up the world

### No universal reasoning scheme

Geared to language  
Sometimes want "extralogical" reasoning

### Start with first-order predicate calculus (FOL)

invented by philosopher Frege for the formalization of mathematics  
but will consider subsets / supersets and very different looking representation languages

### Allen Newell's analysis:

Knowledge level: (semantic)  
deals with language, entailment  
Symbol level: (computational)  
deals with representation, inference

### Picking a logic has issues at each level

- KL: expressive adequacy, theoretical complexity, ...
- SL: architectures, data structures, algorithmic complexity

Next: we begin with FOL at KL
